Abstract. Starburst galaxies are thought to form when two galaxies interact and sometimes merge. These unique objects have high star-formation rates and hence high supernova rates, as well as large reservoirs of very dense gas. Assuming galactic cosmic rays originate in supernovae, starburst galaxies should contain copious quantities of cosmic rays that produce diffuse VHE (E > 100 GeV) gamma-ray emission via their interaction with the gaseous material. This VHE radiation should be detectable by the VERITAS array of 12-m atmospheric-Cherenkov telescopes in Southern Arizona. VERITAS has devoted ∼10% of its total observations in the past two years towards the VHE detection of starburst galaxies. Results from these data will be presented at the conference.

Keywords: VERITAS Gamma-ray Starburst

I. ACKNOWLEDGMENTS

This research is supported by grants from the US Department of Energy, the US National Science Foundation, and the Smithsonian Institution, by NSERC in Canada, by Science Foundation Ireland, and by STFC in the UK. We acknowledge the excellent work of the technical support staff at the FLWO and the collaborating institutions in the construction and operation of the instrument.
